Topic: "Metastatic choriocarcinoma in young woman with neurological manifestations mimicking CNS tuberculosis."

Abstract:

Choriocarcinoma is an aggressive malignancy of gestational trophoblastic disease (GTD) spectrum, which arises from the trophoblastic tissue. Choriocarcinoma generally presents with gynaecological manifestation such as abnormal or irregular vaginal bleeding after pregnancy. Up to 1/3rd of cases may present with non-gynaecological manifestations pertaining to distant metastasis site. Most common site for metastasis is lungs (80%) followed by vagina, liver and brain in decreasing order. Abnormal bleeding at these locations could be the primary presentation due to the rich vascularity of lesions at these sites. We are presenting a case of metastatic choriocarcinoma in 28-years female (G4 P2 L0 A1), who was admitted into neurology department with c/o headache, fever, nausea and vomiting for 15 days.
