

Clinical Death Review

Date : 26.10.2024

Time: 03:30 PM – 04:30 PM

Day : Saturday

Venue: HLT-2, Charak (Lecture Hall)

Moderator: Dr. Sanjeev Pandey, Associate Professor, Department of Neurosurgery

Presenters: Dr. Ankit Bhatia, SR3, Neurosurgery

Abstract:

Stroke is a generic term that describes a clinical event characterised by sudden onset of a neurological deficits. Not all strokes are the same

Broadly we categorise strokes into two types

1. Ischemic stroke (80%) more common
2. Haemorrhagic stroke (20%)

Death or dependent state is the short term outcome in more than 70% of patients. Hypertension is the most common cause of haemorrhagic stroke in elderly patients. Most common intracranial location of hypertensive bleed is basal ganglia followed by thalamus. Thalamic bleed becomes more complicated due to its proximity to third ventricle. This proximity results in quick intraventricular spread of hemorrhage to all the ventricular system. Once intraventricular hemorrhage ensues, it leads to a new cascade of complications including obstruction to CSF flow and resulting hydrocephalus and brain herniation. Six month mortality in thalamic hematoma goes as high as 80%.

In the current Clinical Death Review from Neurosurgery department, we present a case of thalamic hemorrhage, succumbing to death.
