Topic: “Diabetic foot: Genetic basis, metabolic memory, and current treatment guidelines.”

Abstract:

Diabetic foot complications are a major cause of morbidity and mortality in individuals with diabetes. This presentation explores the pathophysiology of diabetic foot, focusing on the roles of neuropathy, ischemia, and infection. It underscores the importance of early detection and preventive measures, such as regular foot examinations, patient education, and appropriate footwear. The presentation also discusses various management strategies, from conservative treatments to advanced surgical interventions per recent treatment guidelines. By understanding the complexities of diabetic foot, healthcare professionals can better prevent and manage this debilitating condition, ultimately improving patient outcomes.

We will also discuss the recent developments in the pathophysiology and genetic mechanisms involved in the diabetic foot spectrum and suggest avenues for further research and management.
